Signal Correction The signal correction tool provides the ability to calculate electrical signals in a selected area (a area is selected either by the mouse or the keyboard). This tool provides the means to eliminate false alarms by removing the detected anomalies from the signal. Majority of the anomalies are the following : splash from a surface object, water etc... For all these anomalies, if the whole detected area is eliminated from the electrical signal, there will not be any further processing. The features of the signal correction tool are summarized as follows: Feature Description 1. Signal threshold Allows you to adjust the maximum signal to noise ratio (SNR) threshold. 2. Signal anomaly detection Allows you to define a threshold in which the anomalies will be considered significant. 3. Signal anomaly elimination Allows you to delete the detected anomalies or to assign them to the anomalies analysis mode. 4. Signal anomaly analysis Allows you to analyze the detected anomalies manually on the map and to eliminate the false alarms by choosing one of the analysis modes. 5. Anomaly analysis Allows you to process the detected anomalies according to their size and shape, type and order. 6. Anomaly detection intensity Allows you to define the intensity of the anomaly detection and elimination. 7. Detector range Allows you to define the maximum search range for the detector. 8. Calibrations Allows you to define the calibration type for the detector. 9. Map calibration Allows you to define the calibration type for the map. 10. Averaging Allows you to define the number of averaging operations performed on the measurement data. 11. Deviations Allows you to define the number of deviations on the average measurement. 12. Average value Allows you to define the average value of the deviation. 13. Maximum value Allows you to define the maximum value of the deviation. 14. RMS value Allows you to define the RMS value of the deviation. 15. Minimum value Allows you to define the minimum value of the deviation. 16. MPE value Allows you to define the MPE value of the deviation. 17. Spike number Allows you to define the number of spikes on the average or maximum average value. 18. Spike duration Allows you to define

The company's website is visualizer 3d okm keygen 21 of the Czech Republic. It seems to be a very new development to the point of there being no info at all online, all email responses go unanswered and telephone calls are not returned. They have not even provided an English language translation. It has just been that they will fix the problem and put it back online. So I hope they do. 5 Visualizer 3D is an especially designed visualization software for OKM metal detectors, which represents detected targets in 3D.
